

How do I create an SPF record and where do I add this?

Artikelnummer: 1586 | Waardering: Nog geen waardering | Laatst bijgewerkt: Fri, Sep 28, 2012 2:07 PM

You can create an SPF record through the following [wizard](#).

We cannot create this for you because we do not know the parameters. Once your SPF record created you add it to the DNS of your domain as a TXT record.

Below you will find an example of a possible SPF result: mydomain.com.

```
v=spf1 mx ip4:69.63.211.0/25 ip4:64.85.73.0/25 ip4:81.103.251.0/24 ip4:212.123.6.155  
ip4:85.68.94.189/32 include:abcd.com include:hostbasket.com -all:86400
```

But it might be shorter e.g.: **v=spf1 a -all**

The result depends on the parameters you indicate when creating the record.
