

How to install dotnetnuke 09.02 on our webhosting ?

Article Number: 2929 | Rating: Unrated | Last Updated: Tue, Oct 8, 2019 2:19 PM

The steps you need to follow are listed below:

1. Download DotNetNuke 09.02.00 from the download page <http://www.dnnsoftware.com/Community/Download> and click 'install package'. The 45 MB zip file "DotNetNuke_Community_09.02.00_Install" will be created.
2. Extract the zip file to a folder on your computer.
3. Make sure your website and database on the Hostbasket web hosting platform are empty.
4. Open an FTP client and upload everything from that folder to the **root** (IMPORTANT!) of your site.
5. Open the site URL in your browser. The installation page will open (this takes a few minutes because many things are loaded into the application pool).
6. The following screen opens
7. Enter the following data under SQL information
 1. Administrative information: select a username and password
 2. Website information: you choose the name yourself, and you pick the remaining items from a list
 3. Database information: (note: you must fill in the following details exactly as shown here)
 - Setup must be 'Aangepast' (customized)
 - Database type: SQL server database
 - Server name: the name of the SQL server at Hostbasket e.g. sqlcluster.hostbasket.com
 - Database name: the name of the database associated with the package
 - Object qualifier: leave blank
 - Security: to be configured by the user
 - Database username: user with DBO rights created for the package
 - Database password: password for the user specified above
 - Tick 'Database owner'
8. Click 'Next' at the bottom of the page, and let the installation run
9. 'Done': your DotNetNuke is configured
